

# Webpower SMTP

Version October 2016

Webpower BV  
Koolhovenstraat 1k  
3772MT Barneveld

## INTRODUCTION

The Webpower SMTP solution is an extension to the Webpower SaaS application complementary to the SOAP API for sending single mails. This allows clients to send single mails using the SMTP API via Webpower mailings. The SMTP API is like a simple SMTP relay facility but using extra Webpower capabilities. Emails are send out using the defined Sender address in the mailing of Webpower. We will use the term 'Webpower SMTP' as name for this extension in this document.

Contact email addresses are still verified against the Webpower blacklist and the license bounce groups just as a normal mailing. This results in cleaner send out even if the client injects contacts into the Webpower SMTP which are in the spam complaints group.

Security is enforced by using encryption with the STARTTLS option in the SMTP transaction. In addition, a username and password is enforced. Failing to use both will result in a block of the SMTP send. So the Webpower SMTP is no 'Open relay'.

To keep list management clean at the clients end we sent bounces back to the client on a special 'Forward bounces to' email address. This means that the client needs to parse these bounces (Non-Delivery-Reports).

## FEATURES

- Attachments can be sent using Webpower SMTP.
- Multi Sending Domains can be used (EU and CN).
- Return Path Domains (CN only) can be used.
- The Sender Email Name can be defined by the sender, however that email address is overridden by the sender address defined in the mailing settings.
- Clicks will be measured when titles are added to links. This is done automatically with the 'Auto Link Titles extension' enabled.

## REQUIREMENTS

The customers application must support SMTP with STARTTLS and Authenticated SMTP to send out mail using the SMTP API.

For more information on AUTH SMTP, see

[https://en.wikipedia.org/wiki/SMTP\\_Authentication](https://en.wikipedia.org/wiki/SMTP_Authentication).

The Webpower SMTP API v2 (EU, CN) can be used with existing licenses. The SMTP API send out requires a specific mailing setup as described in the Setup Procedure.

An email address for feedback of bounces is required. This 'Forward bounces to'-mail address should parse the Non-Delivery-Reports (NDR) and filter out the email addresses in the clients contact list, so the contact is not mailed again.

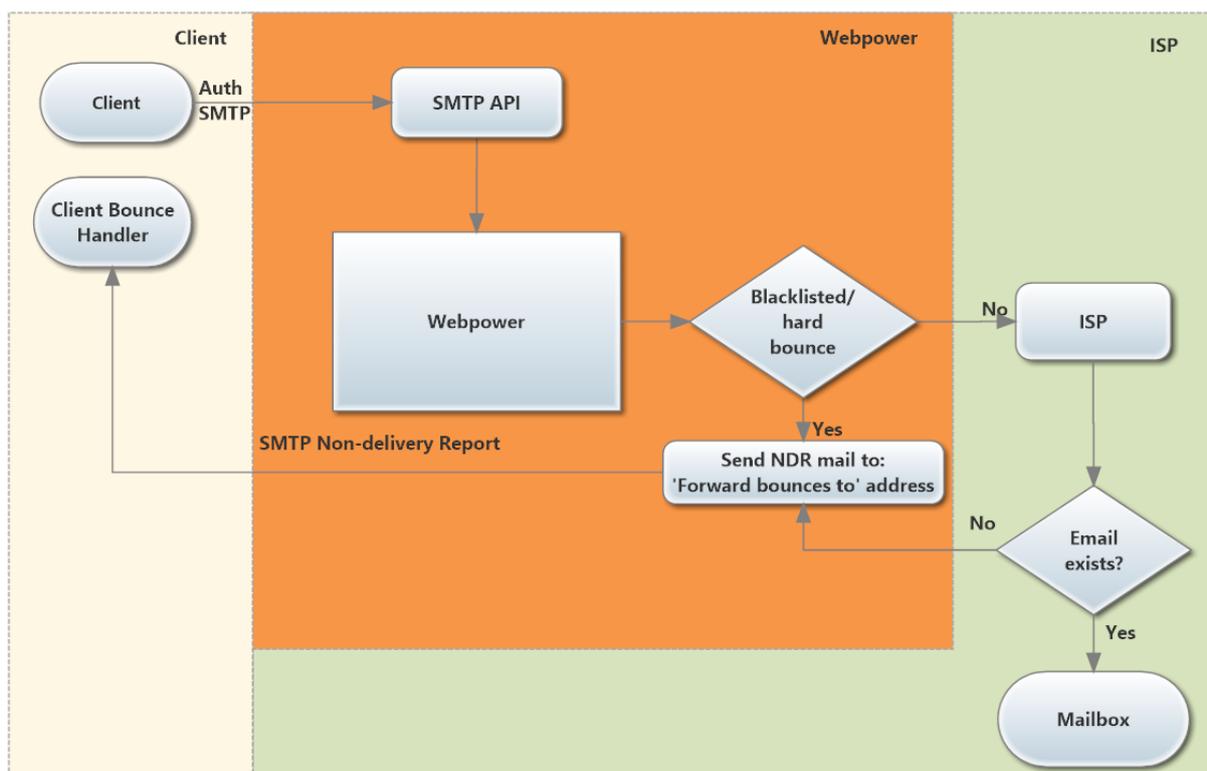

## SCHEMATICS

In the Client section you see that the client connects to the Webpower SMTP API using Authenticated SMTP. There is also the 'Client Bounce Handler' to parse Non-delivery Reports.

In the Webpower section we see that the Webpower SMTP is an extension to the Webpower Application and interacts using a special API. The Webpower Application checks the contact email address against the regular list if this contact should be mailed at all. If it should not be mailed then a Non-Delivery-Report is send to the client on the 'Forward bounces to'-mail address. If the contact is fine to mail, we send it to the ISP serving the contact email address.

In the ISP section we see that the ISP sends a bounce to the Webpower Application. The Webpower Application will see that the bounce is linked to a Webpower SMTP mailing and will therefore forward the bounce to the client on the 'Forward bounces to'-mail address.

## SETUP PROCEDURE

The Webpower SMTP can be used in a new license or with an existing license for Webpower SMTP send outs. If the client is new then we should first follow the usual license request procedure.

The setup procedure for an active license is as follows:

1. A Webpower admin enables the Webpower SMTP extension for that license.
2. A Webpower admin adds credentials for an authenticated user for sending SMTP.
3. These credentials are send to the client by the account manager.
4. Webpower will create a default Webpower SMTP campaign with a mailing especially for Webpower SMTP usage.
5. The client now can use the Webpower SMTP

## USING THE WEBPOWER SMTP

Clients must connect to the following address in Europe to send out their Webpower SMTP mails:

server name: prod-nl-smtp.webpower.eu

server port: 25

Clients must connect to the following address in China to send out their Webpower SMTP mails:

server name: prod-cn-smtp.webpower.asia

server port: 25

The SMTP access will be limited by Authenticated SMTP using the following settings:

encryption method: STARTTLS

password method: Normal

This can be tested using Thunderbird or any other Email client before it is used in a Business application.

## **How to use Multi Sending Domains and Multi Return-Path Domains**

We have two mechanisms to send out mail with the Webpower SMTP:

### **1. Sending using the default campaign and mailing**

This happens if you don't specify a specific email address. Any mail will always be send using this campaign and mailing, unless you use the next mechanic.

### **2. Sending using a specified campaign and mailing**

If you send a mail into the Webpower SMTP with a specified email address like:

`<campaignID>-<mailingID>@client.org`

then you do a send out that is specified by the sender address in the campaign with ID `<campaignID>` and the mailing with ID `<mailingID>`. The domain name is not relevant, so it may be `client.org` or anything else, since the Webpower SMTP sender address is overruled by the mailing sender address at the final send out.

Mechanism 2 can be used to send out mails using Multi Sending Domains and Multi Return-Path Domains. The difference between the two is that with Multi Return-Path Domains you must create one Webpower SMTP campaign (and one mailing) for every Multi Return-Path Domain. With Multi Sending Domains you can simply choose a sender domain in the mailing, so here you can have multiple sender domains in one campaign.

So when using:

### **Multi Sending Domains**

You can use any mailing in any campaign since you define with the sender address what Sending Domain is used.

### **Multi Return-Path Domains**

You will need to create one campaign per Return-Path Domain. In that campaign you define what domain to use. Every mailing in the campaign uses that Return-Path Domain.

### **The Email Name override feature**

An email address in the email client can consist of an Email Name and the Email Address, so if you see this:

"Company Newsletter" news@newsletter.client.org

Then the "Company Newsletter" part is the Email Name and 'news@newsletter.client.org' is the Email Address

In the Webpower SMTP it is possible to override the Email Name in the send mails:

- **Use the Webpower configured Sender Name**

If no email name is specified then the default of the Webpower mailing will be used.

- **Specify the Email Name in the original mail**

If an email name is specified then it will be used in the send mail to the contact. So it overrules the configured Email Name in the Webpower mailing. Be aware that the email address is not overruled.

## SETTING UP A SMTP MAILING USING THE WEBPOWER

### GUI

Within the license create a campaign to be used for the default Webpower SMTP mailing (Setup → Campaigns → Insert). This campaign must be dedicated for use only with the Webpower SMTP. Since we need to set a special 'Forward bounces to' mail address all those bounces would also be forwarded if you would do a bulk mailing with it. That is not desired, therefore a separate campaign for Webpower SMTP mailings is needed.

When creating the campaign be sure to fill in the 'Forward bounces to' section. With this setting the send out process and the bounce handler at Webpower will know where to send bounces to.

The 'Forward bounces to' field is found at the bottom of the campaign. You can do this even for existing campaigns if you want to use them for Webpower SMTP mailings.

Forward bounces to

user@server.com

Expiration date

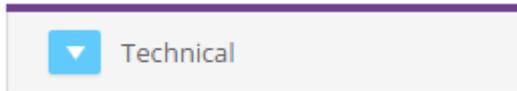

yyyy-mm-dd

Now create a new mailing (Content → emails → Insert). Don't select a template

The subject must be:

Then and open up the 'Technical section'

And change the 'Edit mode' to textarea:

Edit mode \*

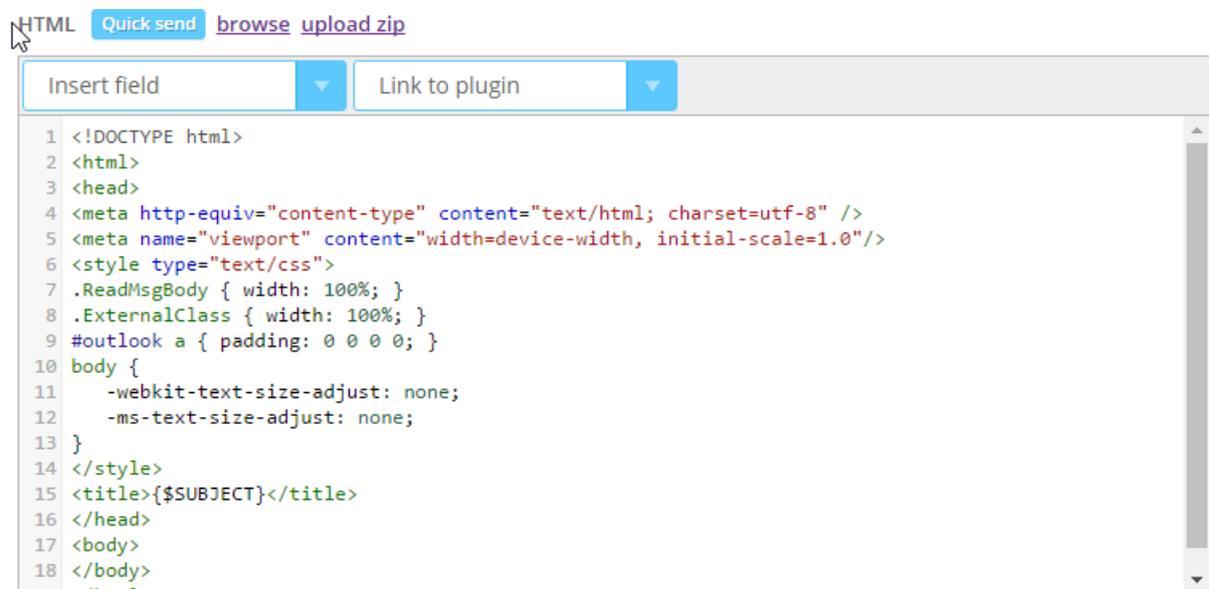

*Always select WYSIWYG. If you select Textarea, then the HTML of the mailing will no longer be validated (by HTMLtidy), which can lead to errors quickly.*

*Use Textarea at your own risk!*

WYSIWYG

Textarea

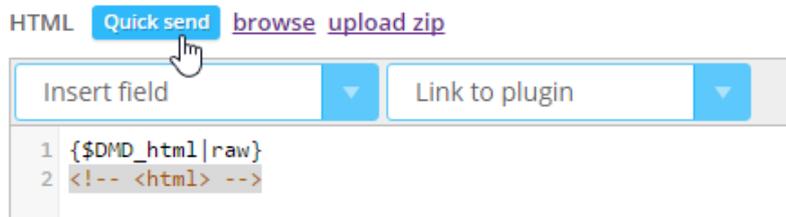

Now edit the HTML of the mailing and you get this:

Delete everything and change the HTML content into:

```
{DMD_html|raw}
<!-- <html> -->
```

It will look like this:

'Save & close' the mailing. The mailing can now be used for SMTP mailings.

If you need to know the campaign ID and mailing ID, then you can use the 'show table columns'-button, as below:

The campaign ID can be seen in the GUI URL at the campaign= location. The ID is 1 in the below example.

<https://dmdtest.dmdelivery.com/admin/?campaign=1&>

## STATISTICS

By default, all bounces and opens are tracked for emails that are sent through our Webpower SMTP.

**If 'titles' are added to any links, then the clicks for these links will also be tracked. If there is a dedicated SMTP environment then the 'Auto Link Titles'-extension can be enabled and clicks will be measured automatically. This is only a default setting in China, but not in Europe! If you want this to be enabled contact the Account Manager.**

These are the statistics you can normally get:

### SMTP test All sendouts

Subject:	Campaign:	Timespan:
{SDMD_subject}	test campaign	12 August 2015 - 12 August 2015

### Summary

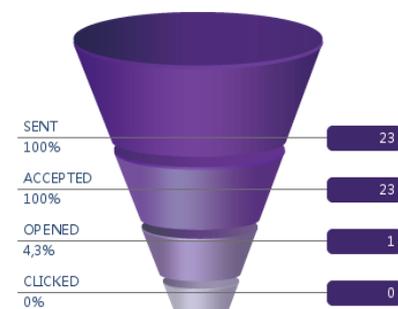

#### percentages compared to total emails sent

	Number	Percentage
<i>i</i> <a href="#">Total emails sent</a>	23	100%
<i>i</i> Hard bounces ( <a href="#">1x</a> , <a href="#">2x</a> , <a href="#">3x</a> )	0	0%
<i>i</i> Soft bounces ( <a href="#">1x</a> , <a href="#">2x</a> , <a href="#">3x</a> )	0	0%
<i>i</i> Total emails accepted	23	100%

#### percentages compared to total emails accepted

	Number	Percentage
<i>i</i> Currently active	0	0%
<i>i</i> <a href="#">Total emails rendered</a>	4	17.4%
<i>i</i> <a href="#">Unique emails rendered</a>	1	4.3%
- in email client	1	4.3%
- in browser	0	0%
<i>i</i> <a href="#">Unique emails opened</a>	1	4.3%
<i>i</i> <a href="#">Total click-throughs</a>	0	0%
<i>i</i> <a href="#">Unique click-throughs</a>	0	0%
<i>i</i> Click-to-Open rate (CTO)	-	0%
<i>i</i> <a href="#">Total trigger hits</a>	0	0%
<i>i</i> <a href="#">Unique trigger hits</a>	0	0%
<i>i</i> <a href="#">Unsubscribers</a>	0	0%

#### data based on unique recipients

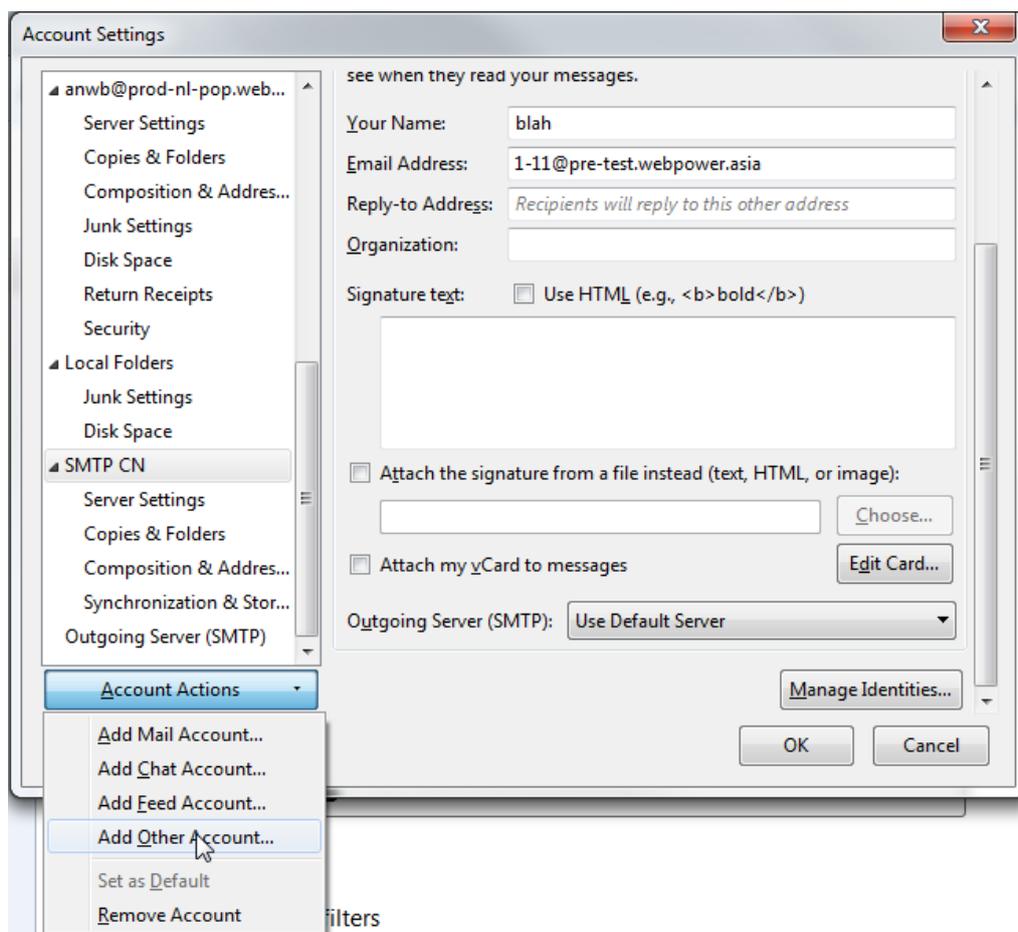

## TESTING THE WEBPOWER SMTP USING THUNDERBIRD

You can test the Webpower SMTP yourself before integrating it into your own application. For this you can use Mozilla Thunderbird which is downloadable on the URL <https://www.mozilla.org/nl/thunderbird/>.

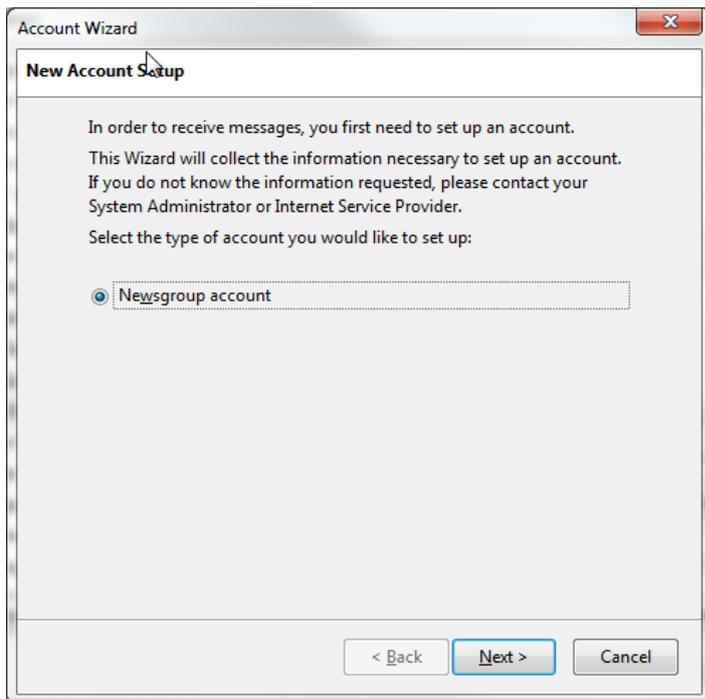

If you have no Thunderbird account yet, then we first add a News account which we will use in the end for the Webpower SMTP test. Adding a 'Mail Account' will not work since you don't have a full mail account to setup.

### Adding an account

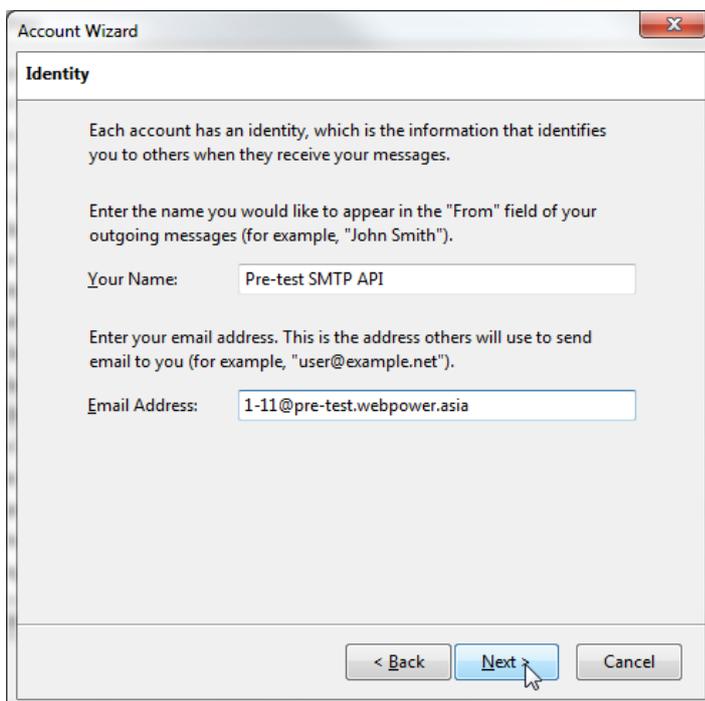

Open up the 'Account Settings'.

Under 'Account Actions' click 'Add Other Account'.

Click 'Next'

Fill in an appropriate name and specify the sender address which you want to use.

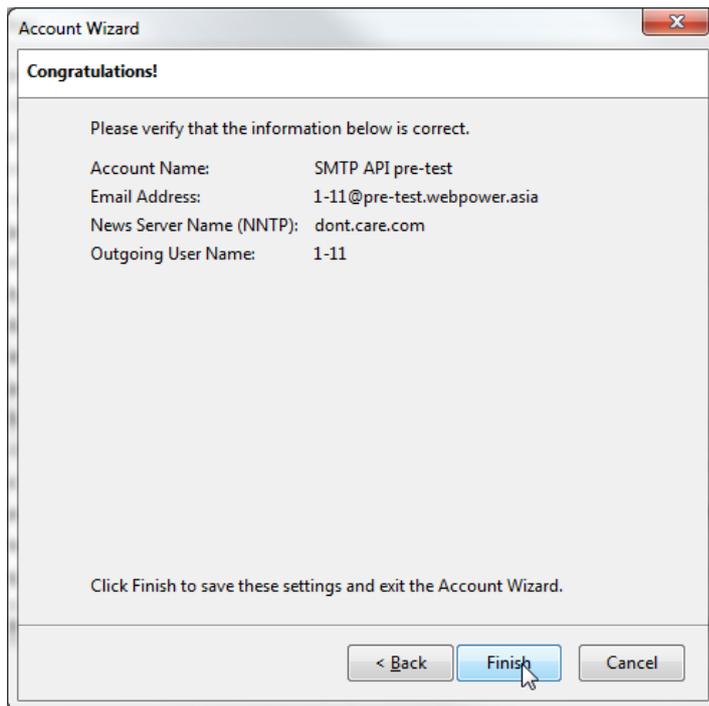

Remember that using a <campaignID>-<mailingID>@client.org sender address will enable you to test any mailing in the Webpower SMTP setup. Click 'Next'.

This is a screenshot of the 'Account Wizard' dialog box, specifically the 'Incoming Server Information' step. The window title is 'Account Wizard'. The main heading is 'Incoming Server Information'. Below the heading, there is a text prompt: 'Enter the name of your news server (NNTP) (for example, "news.example.net").'. Underneath this prompt is a text input field labeled 'Newsgroup Server:' containing the text 'dont.care.com'. At the bottom of the dialog, there are three buttons: '< Back', 'Next >', and 'Cancel'. The 'Next >' button is highlighted with a blue border.

Fill in a random domain or 'dont.care.com' NNTP server; then click 'Next'.

This is a screenshot of the 'Account Wizard' dialog box, specifically the 'Account Name' step. The window title is 'Account Wizard'. The main heading is 'Account Name'. Below the heading, there is a text prompt: 'Enter the name by which you would like to refer to this account (for example, "Work Account", "Home Account" or "News Account").'. Underneath this prompt is a text input field labeled 'Account Name:' containing the text 'SMTP API pre-test'. At the bottom of the dialog, there are three buttons: '< Back', 'Next >', and 'Cancel'. The 'Next >' button is highlighted with a blue border.

Fill in a descriptive Account name. Click 'Next'.

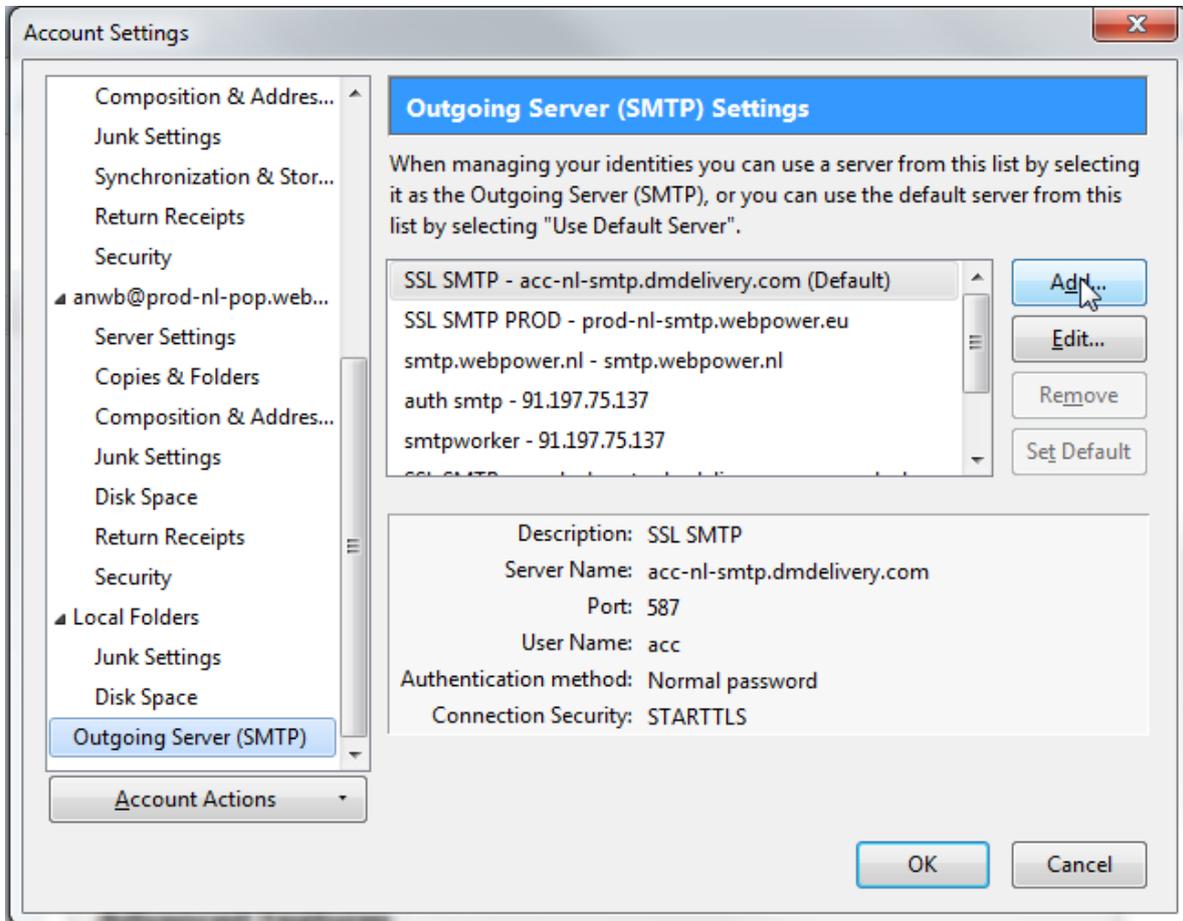

Review the settings and click 'Finish'

We now have an account to select for sending a test mail, but this account should use the Webpower SMTP for send out. So now we will add an 'Outgoing Server (SMTP)' to make that happen.

## Adding an 'Outgoing Server (SMTP)' to Thunderbird

Click on the 'Outgoing Server (SMTP)' in the Account Settings.

Click on the 'Add' button.

A screenshot of a 'SMTP Server' settings dialog box. The dialog has a title bar with a close button. It is divided into two sections: 'Settings' and 'Security and Authentication'. In the 'Settings' section, there are three fields: 'Description' with the value 'SMTP API CN', 'Server Name' with the value 'prod-cn-smtp.webpower.asia', and 'Port' with a spinner set to '25' and a 'Default: 587' label. In the 'Security and Authentication' section, there are three fields: 'Connection security' with a dropdown menu set to 'STARTTLS', 'Authentication method' with a dropdown menu set to 'Normal password', and 'User Name' with a text box containing 'pre-test'. At the bottom of the dialog are 'OK' and 'Cancel' buttons.

Fill in the settings using the following information for China:

Description: SMTP API CN

Server Name: prod-cn-smtp.webpower.asia

Port: 25

Connection security: STARTTLS

Auth. method: Normal Password

User Name: smtp-<client>

Fill in the settings using the following information for Europe:

Description: SMTP API EU

Server Name: prod-nl-smtp.webpower.eu

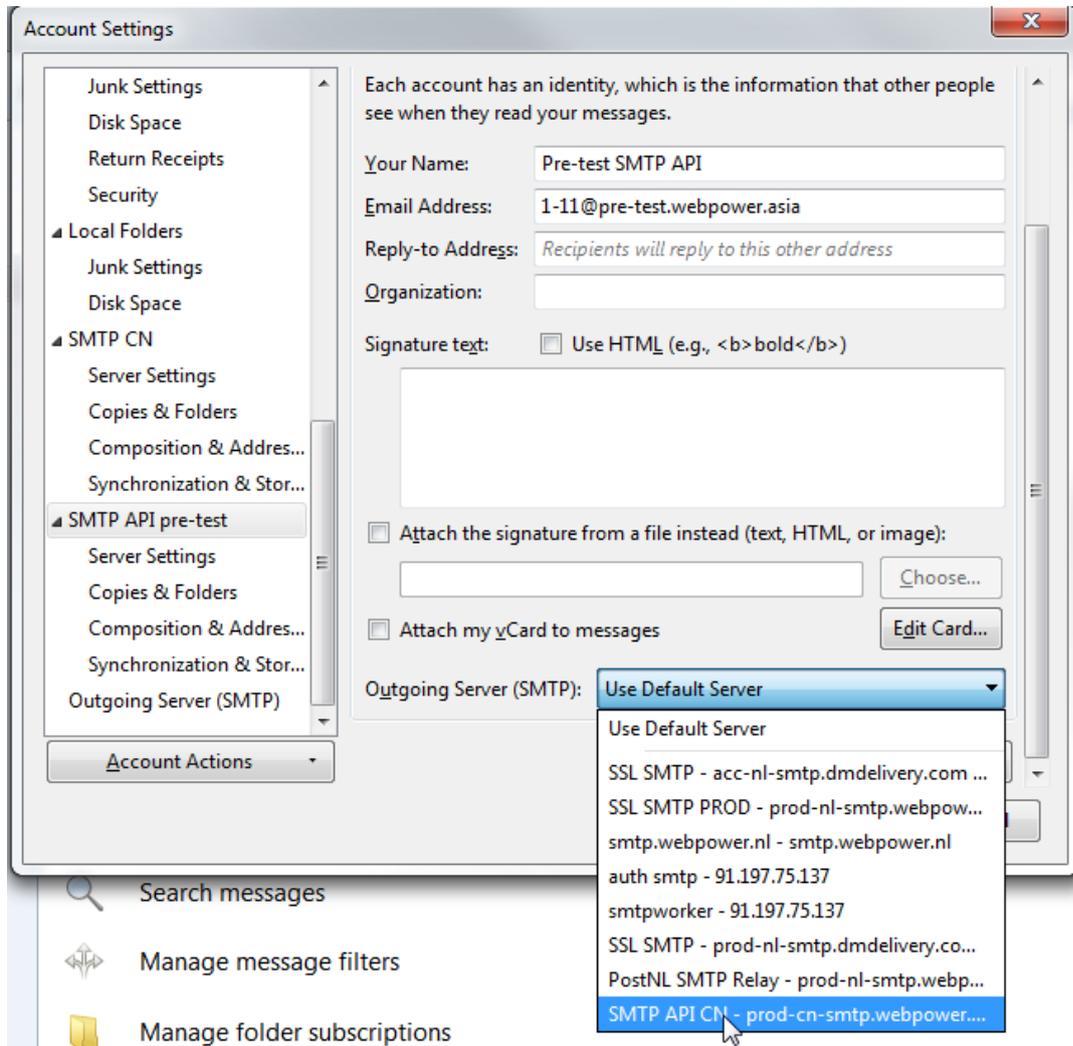

Port: 25

Connection security: STARTTLS

Auth. method: Normal Password

User Name: smtp-<client>

Now we will bind the 'Outgoing SMTP' to the created account.

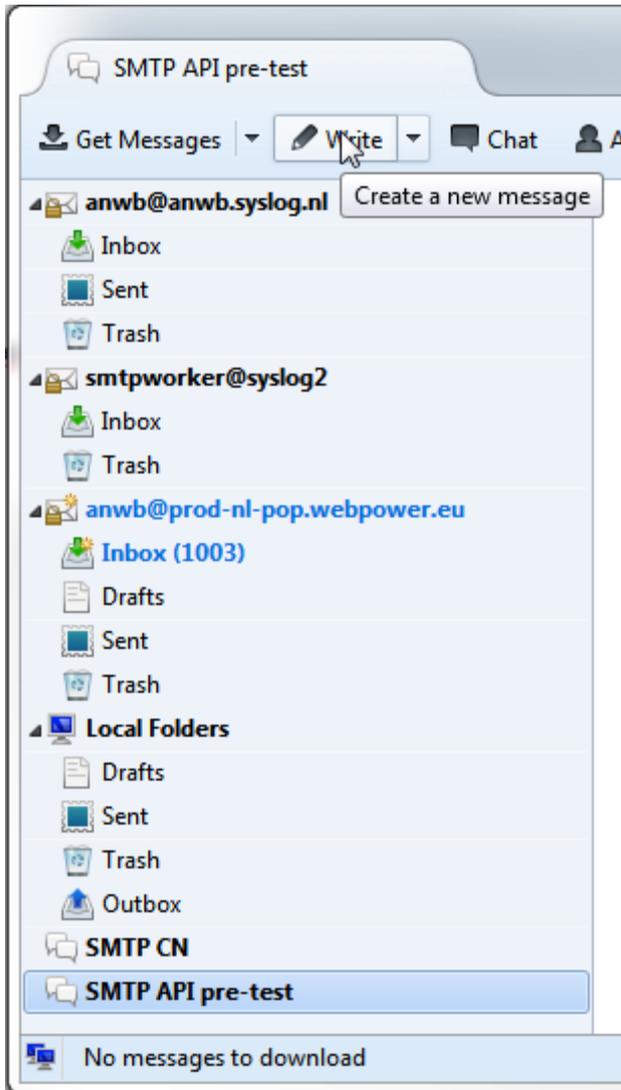

Click on the license (in our case 'SMTP API pre-test') and go down in the settings to the 'Outgoing Server (SMTP)'. Click on the pull-down and select the freshly made 'SMTP API CN'. Then click 'OK'

Now we are setup to start testing.

## Sending a message using the SMTP API

In the Thunderbird main window, select the 'SMTP API pre-test' account, then click on the Write button.

Write a subject and some mail content and press Send. You will now be presented with a popup to fill in the password.

The mail is sent if you have the right password.
